

S-Pak

S-Pak seals in moisture, secures clenched nails, and adds support to weak hoof walls. Sole Pak's S-Pak solution seals in much needed moisture that aids in preventing hooves from chipping and cracking. Hawthorne's S-Pak will not wash off and essentially must grow out with the hoof.

1. A clean dry hoof is necessary and the optimal time to apply S-Pak is immediately after shoeing or trimming the hoof. The first application with S-Pak resin acts as a primer. Apply the solution to the outside hoof wall above the nail holes taking great care to work the primer into the nail holes or any cracks. Note that this product should not be applied to the coronary band, the sole or the frog. Use only on the outside hoof wall as a sealant.
2. Add hardener to resin to create a 50/50 solution. Shake or stir well.
3. Apply 50/50 solution on top of the primed area.
4. Allow solution to set-up for approximately 8 minutes; set-up may take slightly longer in cooler damp climates.
